MONTHLY WEATHER MAP

MAY 1961

General Summary of Weather Conditions

For the first two weeks of May the upper air circulation was predominantly from the west over the southern half of Canada. The resulting weather pattern brought cool weather to the west, while central and eastern Canada experienced marked day to day changes in temperature, although the average was near normal. During the latter half of the month a marked trough developed aloft off the British Columbia coast in association with a ridge over western Canada and a trough near the lower Great Lakes. This pattern brought warm dry weather to western Canada and successive outbreaks of cold Arctic air to the Great Lakes region and western Quebec. Associated with this pattern were a number of vigorous storms that moved northward across the Maritime Provinces.

Mean temperatures for May were normal or slightly above normal in British Columbia and the Prairie Provinces as well as in northern and central Quebec, along the Labrador coast and in the Maritime Provinces. Temperatures averaged below normal throughout Ontario, in the southern sections of Quebec, and in the eastern Arctic.

May precipitation totals were above normal in the interior of British Columbia, parts of Quebec and Labrador and a large section of northern Ontario. However, the greatest rainfall was experienced in the Maritime Provinces, especially in New Brunswick where many stations reported over nine inches during the month. Rainfall was deficient on the Island of Newfoundland, in the southern districts of Quebec, and the Province of Manitoba, with scattered dry areas elsewhere.

In British Columbia the first two weeks of May were cloudy and cool. Despite this, mean temperatures for the month were within a degree of normal throughout the southern sections of the Province. In the central interior these were a few stations with mean temperatures for the month one or two degrees above normal. In the far northern part of the Province there were generally temperature deficiencies of two to four degrees.

The first two weeks of May were wet in British Columbia, with measurable rain reported on more than half the first fourteen days. The next week was comparatively dry and there were two or three dry days at the end of the month with several spells of unsettled weather in between. May precipitation totals were well above normal on Vancouver Island, on the Fraser delta and in the southern interior valleys. The greatest precipitation excesses were reported from the central interior where stations in the Smithers - Hazelton area experienced over twice the normal fall for the month. By contrast, precipitation was light along the northern part of the British Columbia coast, and there were small deficiencies on the Queen Charlotte Islands. The greatest precipitation total reported for the month in the province was 9.13 inches at Seymour Falls, just north of Vancouver.

The first two weeks of May were cool in the Prairie Provinces. However, in the latter part of the month maximum temperatures soared into the eighties at most stations. Toward the end of the month, temperatures of 94° were recorded at Gravelbourg, Sask., and Brandon, Manitoba, and these were the highest temperatures in Canada during May 1961. Mean temperatures for the month were one or two degrees above normal throughout Alberta, normal to two degrees above normal in Saskatchewan and close to normal on the grain areas of Manitoba. In the part of Manitoba north of the Manitoba lakes the few stations reporting had temperature excesses of three or four degrees.

Substantial above normal precipitation amounts were recorded in the Alberta foothills in May, while thunderstorms on May 30 produced heavy rain in the area south of Regina and Moose Jaw. Near the International Border hail was reported, and some farmlands were flooded. There were unofficial reports of six to eight inches of rain, although the highest official figure was 3.5 inches at Carlyle. Manitoba was dry, all areas experiencing deficiencies of forty to sixty per cent. Winnipeg reported the second sunniest May on record, with no measurable rainfall during the last 21 days of the month.

Temperatures fluctuated widely during May in the Province of Ontario, but were more often below normal than above. The coldest weather was in the first few days of the month, when many southern Ontario stations reported minimum temperatures below freezing. Temperatures were again unseasonably cold and frost occurred at a few places on the 26th. Maximum temperatures reached the eighties at most places on the 14th, in a three day warm spell that brought the only really warm weather of the month. Mean temperatures were two to four degrees below normal throughout southern Ontario, and one to three degrees below normal in the northern districts, except in the western districts of Kenora and Rainy River where temperatures were just above normal.

May precipitation was irregularly distributed across Ontario. There were small excesses in the eastern counties extending roughly from Lake Simcoe to Brockville, but the remainder of southern Ontario received less than normal precipitation, deficiencies ranging to forty per cent generally and to seventy per cent on the Bruce Peninsula and Manitoulin Island. In northern Ontario, precipitation was heavy in a broad band stretching from New Liskeard to Lake Nipigon. A few stations in the centre of this area had over twice the normal fall. In the extreme western part of the Province there were small deficiencies.

May was cool throughout the southern districts of Quebec. There was one warm spell which brought maximum temperatures into the eighties in the Montreal area on the 13th, 14th and 15th of the month, but this was more than offset by cool weather at the first of the month, and again on the 31st when the minimum temperatures dropped below freezing at a number of places in the Eastern Townships and the Montreal area. Mean temperatures for the month were generally one to three degrees below normal except the upper part of the Ottawa River valley where there were temperature deficiencies of four or five degrees, and on the Gaspe Peninsula where mean temperatures were one or two degrees above normal. In the central and northern parts of the Province, on the other hand, all stations reported May mean temperatures normal or one degree above normal.

May precipitation totals were below normal in most of the southern districts of the Province of Quebec. On the 27th a low pressure area over New Brunswick was accompanied by heavy thunderstorms on the Gaspe Peninsula and the Sept-Iles region. Many stations in this region reported over two inches of rain from this storm and there were floods in the Gaspe area. Monthly totals were two to two and a half times the normal fall on the Gaspe Peninsula. In the central and northern sections of Quebec, excesses and deficiencies were equally frequent with no particular pattern in evidence.

May was a very stormy month in the Maritime Provinces. Storms of greater or less intensity occurred at intervals of a few days throughout the month. On the 19th, 20th and 21st an intense storm moved through the district bringing over two inches of rain to Sydney and heavy rain to the remainder of the Maritime Provinces, and four or five inches of snow to northern New Brunswick. On the 27th a severe storm brought very heavy rain to New Brunswick, particularly the western half. The total rainfall for the 26th and 27th was over five inches at many stations in the Saint John River valley, and two stations had amounts over six inches. They were Tower Hill with 6.51, and Brockway with 6.94 inches for the two days. These heavy rains, together with previous rain, and water from snow melting caused serious floods along the major New Brunswick rivers. A number of stations in the interior of New Brunswick experienced over nine inches of rain during the month, and the total of 10.81 inches at Brockway was the heaviest precipitation reported by any station in Canada during the month. In New Brunswick precipitation totals were two to four times normal, while in Nova Scotia and Prince Edward Island there were excesses ranging to eighty per cent but averaging forty per cent.

Despite the stormy conditions in the Maritimes during May, mean temperatures for the month were not very far from normal. In New Brunswick there were deficiencies of one or two degrees in the interior, but temperatures were normal along the Gulf of St. Lawrence coast. In Prince Edward Island and Nova Scotia, mean monthly temperatures were normal to one degree above normal except for a few scattered stations with one degree below normal.

The first two weeks of May were cool on the Island of Newfoundland. From the middle of the month onward, temperatures increased and the month ended with mean monthly temperatures just about normal in the southern half of the Island, and one or two degrees above normal in the northern half and along the west coast.

A disturbance late in the month brought two inches of rain to the southwestern corner of the Island of Newfoundland, swelling the monthly total at St. Andrews to 6.16 inches which was almost twice the normal fall. However this condition was not general, as most parts of the Island received less than the normal amount of precipitation. Deficiencies ranged to about twenty per cent along the south coast to fifty per cent in the interior. Clear dry weather is reflected in the monthly sunshine totals which were 59 hours above normal at Saint John's, and 30 hours above normal at Gander. The generally below normal precipitation brought dry conditions in the woods and increased the hazard of forest fires.

Along the Labrador coast, May was a little warmer than usual with most stations reporting mean monthly temperatures one or two degrees above normal. Precipitation was two and a half times normal at Goose Bay, but elsewhere along the Labrador coast there were excesses of about thirty per cent.

May was cool in the Yukon Territory, mean temperatures ranging from one to four degrees below normal. Precipitation was over two and a half times normal at Snag, and there was a 25 per cent excess at Dawson. All stations in the southern portion of the Territory experienced precipitation deficiencies which averaged about forty per cent.

May was cool in the Northwest Territories. Temperature was normal at Fort Smith and Aklavik, but all other stations in the District of Mackenzie reported mean temperatures for May of two to five degrees below normal. In the District of Keewatin, mean temperatures averaged about five degrees below normal. In the western Arctic, Sachs Harbour and Mould Bay each had May mean temperatures one degree above normal, but all the remaining stations on the Islands had below normal mean temperatures. The greatest negative anomaly in the country for the month was 9 degrees reported from Arctic Bay.

Almost all stations on the mainland part of the Northwest Territories experienced precipitation deficiencies during May, averaging about fifty per cent in the District of Mackenzie and sixty per cent in Keewatin. On the Arctic Archipelago a few stations experienced precipitation excesses but generally there were deficiencies ranging down to ninety per cent at Arctic Bay. There was no precipitation at Eureka.

MAY 1961

TEMPERATURE, PRECIPITATION AND SUNSHINE

The temperatures for the month are given in degrees Fahrenheit in the temperature columns under the following headings:

MAX. The highest temperature.

MIN. The lowest temperature.

MEAN The mean temperature for the month.

The remaining columns give the following information:

PRECIP. The total precipitation in inches for the month, including the rainfall and the equivalent of the snowfall.

SUN The total bright sunshine for the month.

SNOW ON GRND. The depth of snow in inches, lying on the ground at the end of the month, (when reported).

The use of A following the station name indicates that the meteorological observations are taken at Airport offices.

British Columbia
